

PASTA worksheet

Stages	Sneaker company
I. Define business and security objectives	Make 2-3 notes of specific business requirements that will be analyzed. • <i>Payment process</i> • <i>User can register account with both roles (buyer and seller)</i> • <i>The app should be in compliance with PCI-DSS.</i>
II. Define the technical scope	List of technologies used by the application: • <i>Application programming interface (API)</i> • <i>Public key infrastructure (PKI)</i> • <i>SHA-256</i> • <i>SQL</i> APIs are prioritized because they serve as the primary interface between the application and external systems, making them a critical attack vector. A poorly secured API can expose sensitive data, enable unauthorized access, or be exploited by attackers. Ensuring secure authentication, input validation, and access controls in APIs reduces the risk of breaches and protects overall application security.
III. Decompose application	Sample data flow diagram
IV. Threat analysis	List 2 types of threats in the PASTA worksheet that are risks to the information being handled by the application. • <i>Injection attack</i> • <i>Session hijack</i>
V. Vulnerability analysis	List 2 vulnerabilities in the PASTA worksheet that could be exploited. • <i>Improper data validation</i> • <i>Injection problem</i>
VI. Attack modeling	Sample attack tree diagram
VII. Risk analysis and	List 4 security controls that you've learned about that can reduce

impact	risk. separation of duties, incident response procedures, password policy, and principle of least privilege
